Improvements Made Based on Part 2 Feedback

The feedback received from my lecturer for Part 2 highlighted the need for comprehensive website improvements and a detailed changelog. In response, I improved the Nyavhas M Poultry Farm website by adding JavaScript functionality, an interactive Leaflet map showing the farm and its service areas, and validation for the contact and enquiry forms.

I also improved SEO by adding page titles, meta descriptions, keywords and robots metadata. The CSS design, website layout, navigation and footer were updated to make the website more organised and user-friendly. Finally, website testing was carried out to check the forms, map, navigation and layout.

These improvements address my lecturer's feedback and make the website more functional, informative and easier for customers to use.

Part 3 Development Updates

1. JavaScript functionality

File updated- `js/script.js`

JavaScript functionality was added to improve the interaction between the website and its visitors. The script was used to support form validation, user feedback messages and the interactive map.

Reason for the change - To improve website functionality and provide visitors with a better experience.

2. Leaflet interactive map

Files updated- `contact.html`, `css/style.css` and `js/script.js`

Leaflet was integrated into the Contact page to display an interactive map. Markers were added for Thononda, Tshiheni, Tshithuthuni, Tshiendelu, Mazwimba and Maname. Popup messages were included to identify each service area.

CSS styling was added to control the map's height, width, border and positioning.

Reason for the change To help customers locate the farm and understand which communities are served by the business.

3. Contact form validation

Files updated- `contact.html` and `js/script.js`

JavaScript validation was added to the contact form. The form checks the customer's full name, email address, phone number, subject and message. Error messages are displayed when required information is missing or invalid.

Reason for the change- To reduce incorrect or incomplete contact information and guide customers when completing the form.

4. Enquiry form improvements

Files updated- `enquiry.html` and `js/script.js`

The enquiry form was improved to support customer enquiries about the farm's products, including fresh eggs, live chickens and cleaned chicken. Required fields and input validation were included.

Reason for the change- To make it easier for customers to enquire about available poultry products.

5. Search Engine Optimisation

Files updated- Website HTML pages, `robots.txt` and `sitemap.xml`.

SEO metadata was added to the website pages. Page titles, meta descriptions, keywords, author information and robots directives were included. The robots.txt file and sitemap.xml file were also prepared to support search engine crawling and indexing.

Reason for the change:** To improve the website's search engine information and make its pages easier for search engines to understand.

6. CSS design improvements

File updated - `css/style.css`

The website's CSS was improved to create a consistent design. The green, dark green, light green and gold colours were maintained throughout the website. The map section, forms, content areas and footer were styled to improve readability and presentation.

Reason for the change: To make the website more organised, attractive and consistent with the identity of Nyavhas M Poultry Farm.

7. Footer improvements

Files updated- HTML pages and `css/style.css`.

The footer was organised into four sections: Stay Connected With Us, About Us, Support and Get in Touch. A newsletter form, navigation links and business contact information were included.

Reason for the change- To make important business information and website navigation easier for visitors to access.

8. Website deployment

Platform: Netlify

The website was prepared for online deployment using Netlify. This allows the website to be accessed online instead of only running locally on a computer.

Reason for the change- To make the website accessible to customers and demonstrate how a completed website can be published online.

9. Website testing

Areas tested- Navigation, forms, map, layout and interactive features.

The website was checked to identify errors and confirm that its main features work as expected. Form fields were checked using valid and invalid information. The map was checked to confirm that it loads and displays its markers. Website navigation and layout were also reviewed.

Reason for the change- To identify problems and improve the reliability and usability of the website.

Conclusion

The Part 3 updates improved the Nyavhas M Poultry Farm website by introducing JavaScript functionality, an interactive map, form validation, SEO improvements and a more organised design. The changelog documents the main files updated, the changes made and the reasons for each improvement. These changes demonstrate the progress made after reviewing the feedback from Part 2.
